Working on it!

0

SCIENTIST!!! (nickname)

There are equal amounts of bacteria in and on your body, as there are cells in your body, meaning that *you* are not just your cells, *you* are an **amalgamate** of creatures that form together to create *you*.

The SCIENCE! of Icewings

dragondrawing333

Ymbrynes, from the great book series Miss.Peregrine's home for peculiar children, are women able to reverse time, and turn into birds. Wait. WHAT? They're both Timelords and shapeshifters?

The bird Miss Peregrine turns into is, true to her name, a Peregrine falcon, but how does she do it?

We have a problem, actually, every shapeshifter from every form of media has a problem, the law of Conservation of Mass. The law of conservation of mass states that mass cannot be destroyed or created, just changed from one form to another, a peregrine falcon weighs 1.5 to 3.3 LBS., and the average women weighs 166.2 LBS. So when Miss Peregrine transforms where is all this extra mass going to?

She is doing something with 162.9 LBS., so what IS GOING ON? There are interesting science fiction ways to bypass the Law of Conservation Of Mass, like in Animorphs, the extra mass is being transported to an extra dimensions, that they call Z-space. But I'm not about to teach you how to travel through dimensions. That's my roundabout way to say, I don't know.

The SCIENCE! of Icewings

hydrakitten48

I agree with Cherry, and I did get the reference. I've been reading your theories with the voice of Austin from Game Theory in mind.
Also, I have two suggestions for theories:

- the science of Peril's firescales
- the science of animus magic

(I've been only reading your theories on this thread, so I'm sorry if you already covered these)

The SCIENCE! of Icewings

dragondrawing333

I don't know what the first guy said. But that's actually a really funny story, I've tried to post the SCIENCE!!! Of mind reading twice now, the first time it just didn't show up, and the second time, it showed up, but disappeared the next time the page loaded. I'll post the mindreading tomorrow morning. Also yes i'd love it if you called me SCIENCE!!!

☆ 2

SCIENTIST!!! (nickname)

There are equal amounts of bacteria in and on your body, as there are cells in your body, meaning that *you* are not just your cells, *you* are an **amalgamate** of creatures that form together to create *you*.

The SCIENCE! of Icewings

dragondrawing333

Hydrakitten (cause i have no idea what your nickname is)- Okay first off, why is the world do you use the font SYMBOL, I had to copy and paste what you said into Word and change it to actual ENGLISH!
Also That font is really cool , Yeah a surprising amount of people got the SCIENCE!!! reference, i was certain nobody was gonna get that. I have the SCIENCE!!! Of Peril already typed up, it should be posted in a few days, I'm trying to have a few saved on my computer so i can give you guys one a day, but I'm running out of ideas to write about. And finally, I just don't know how to explain Anumis MAGIC in a way thats not super confusing or even correct, it could be due to quantum entanglement, but it's not, unfortunately i can't do Anumis powers because it's devoid of any real science.

I could do one on the affects of Anumis magic though.

☆ 2

SCIENTIST!!! (nickname)

There are equal amounts of bacteria in and on your body, as there are cells in your body, meaning that *you* are not just your cells, *you* are an **amalgamate** of creatures that form together to create *you*.

The SCIENCE! of Icewings

vanilladragon282

@Science I get your confusion on animus powers. They're more magic than anything reasonable or explainable, and quantum entanglement my brain can't process (Like, what even IS that?). But it *would* be really cool if you could try and SCIENCE! the *effects* of animus dragons. (I'd figure it has something to do with changing someone's DNA and erasing/creating neuron in their brain, for the effects on dragons, and for objects I think it has something to do with changing their molecular structure.) (Side note, any more fandoms we share? Marvel? Percy Jackson?)

The Science!!! Of Nightwing Mind reading

Okay serious talk here instead of a joke, I don't like how this turned out, It feels half-baked. But I'm posting it anyway because the SCIENCE!!! Is really cool, and also really complicated, and I spent a lot of time and headaches developing it, Like, I had to attempt to teach myself NEUROSCIENCE just enough to explain something that may be the exact opposite of SCIENCE!!!. Anyway, On with the THEORY!

So…Brains, Zombies love 'em, and I'm starting to hate them. WAIT!!! Hold up, Just a random question but what do you use your brain for? I use mine to apply SCIENCE!!! To fictional franchises whose creators never thought their own science through, and the occasional Justin Bieber song (JK, Its always Miley Cirus.)

Okay, serious time. Your brain is awesome, it can comprehend things like parallel dimensions and artwork, and it all functions thanks to one thing, *Neurons*. Neurons are small cells that receive, processes, and transmit information through electrical and chemical signals. These signals are super important to your survival, like if you don't have them that it literally what being brain dead is. And if my Theory is correct, what our dear, shy Moonwatcher, has been listening to this whole time.

We know it's possible for a living creature to sense electrical currents, Sharks, for instance, have along their sides, hundreds of sensors called a *Lateral Line,* which they use, to great effect, to locate the electrical output of fish, and other prey. True, the electric output of neurons is absolutely miniscule when compared to any other flow of electricity, but the residents of Phyrria have no electronics (The Horror), meaning almost no interference.

Moon has a silver scale in the corner of each eye, silver scales that only ever appear in Mind readers, what are they for? The book (unfortunately) never gives an answer, but we can assume they're necessary in the mindreading process. So skipping over lots of technical trial and error, mostly error, I came to the conclusion that the silver scales are one of two things. One, it's just a way to tell possible mates "Hey! Mindreader over here, I'm single, super strong, and like long walks on the beach!" Kind of like the bright feathers on male parrots. Or, they're acting like the shark's lateral line, a specialized sensory organ, designed to pick up faint electrical signals and interpret them into understandable data to give the mindreader a leg up on competitors. Or maybe it's both.

-Special thanks to Sylvia for suggesting this topic-

hydrakitten48

@Science: (Can I call you Austin? ^-^) Sorry that my choice of font was troubling you, I promise I didn't mean to make you (and probably everyone else) suffer. Does it look something like Wingdings or Wingdings 2 for you? For me it looks kinda like Times New Roman; maybe that's because I'll most likely be posting on the Chromebook my school is letting me use. I'll fix my siggy right away and I'll start using the regular font for my posts. :)

If reading what I wrote in Symbol was a problem for you (and most likely almost everyone else), then I made a big mistake with choosing that font to post in. I've been using it for all the posts I've made so far, excluding this one.

Also, you can call me Fantasy or Lilac.

The SCIENCE! of Icewings

fogchasing43

I think this is very good. I love science but reading it. I hate practicals. Your grammar, spelling and punctuation is excellent. Your teacher must be proud :) This is a brilliant read!

May may I join in with a theory?

Why Ymbrynes are only female, with your host, Fennec.

This is short. I'm not smart. I'm not a scientist. I'm not SCIENCE!!! I'm trying though. I probably got a lot wrong.

For my example, I will go to cats. Ginger cats. It's more likely for male cats to be ginger due to the colour being affected by the chromosomes. The ginger comes up more with the X chromosome and males have 2. However, some ginger cats can be female (hi Squirrelflight)

Then we have Ymbrynes. I have a theory that something similar is going on. Maybe Ymbrynes need a Y chromosome. There are slight exceptions to this rule. If you've read the books (SPOILERS FOR BOOK 2), you'll know of Carl, Mrs P's brother. He is not a full Ymbryne and lacks time bending abilities but is able to become a falcon. Some maybe he's like a female ginger cat.

This is a bad theory with little science but hey. It's just a theory. A Fennec Theory. And post!

dragondrawing333

Okay, Lilac, Sorry if it came off as aggressive, I actually thought it was pretty funny that i had to use Word, at first glance i thought you were typing in ancient greek. And call me whatever you want, Science, Scientist!!!, Austin, King of the universe, whatever you want.

0

SCIENTIST!!! **(nickname)**

There are equal amounts of bacteria in and on your body, as there are cells in your body, meaning that *you* are not just your cells, *you* are an **amalgamate** of creatures that form together to create *you*.

The SCIENCE! of Icewings

dragondrawing333

Fennec- Thank you so much for the compliments, i'm blushing, you just can't see it.
And i love it when you post, well, just about anything on here, a comment, request, counter-theory, or a theory of your own. My whole purpose for writing these is because i love to make people just a little bit smarter (and i'm a massive nerd who does things like this for fun, but let's go with the more heroic option.)
And on your theory- I was thinking something similar, but couldn't really put it into words, (which you did perfectly) the only problem was you mixed male ginger cats with female ginger cats, the male ginger cats are the rare ones. (I also love the references to Warriors, and Game Theory.)
You did great.

0

SCIENTIST!!! (nickname)

Trey's the SCIENCE!!!! Of Repulsor blasts

This post was written by my best friend TREY!!! He wanted to write a SCIENCE!!!! Essay and needed a topic, so I gave him Iron Man's repulser blasts. HAHAHAHAHA! I tricked you into doing school!

First we want to start off with what the heck is PLASMA!!! Well it's an ionized gas consisting of positive ions and free electrons in more or less no overall electric charge. Plasma is also a main thing in the blasters. The Repulsors are units which are connected through the Arc Reactor, from where it gets energy and its primary use is as a flight source (Propulsion) and secondary function is as a weapon. The Repulsors work by taking excess electrons and turn them into muons, which have ability to penetrate deep into atomic matter, which are then fed into hands and chest piece of any iron man suit. I forgot to also add Plasma is created by adding energy to a gas so that some of its electrons leave its atoms. In any way I hope this will help you understand some of the physics.

Foot-note: From now on, if I post something in the font Comic Sans, then it's me writing, if it's in the font Impact then it's Trey writing.

2

SCIENTIST!!! (nickname)

There are equal amounts of bacteria in and on your body, as there are cells in your body, meaning that *you* are not just your cells, *you* are an **amalgamate** of creatures that form together to create *you*.

fogchasing43

Thank you so much! I'm glad you thought it was a good theory.

However, though I hate to argue with anyone, I did a quick Google search and it did say that ginger males were more likely. 80% of them are male apparently. It's the Internet though so maybe it's a lie. It did say males were less likely to be tortoiseshells though. I don't know, as I said, Internet.

Well done for getting the references! Do you know there's also Film Theory by the same people?

The Science!!! Of Peril

Peril is socially awkward, love stricken, and constantly on fire. Okay, one of those things is not like the others.

Peril the Skywing, is what is referred to as a firescale dragon, these dragons appear only in the Skywing tribe, and their scales, as the name suggests, are incredibly hot, like metal melting hot. But how is this so? That's what I'm here for.

So to start with, we'll have to figure out how hot Peril's scale's get, it sounds like this would be really hard right? Well it's not, see Peril doesn't burn everything she touches, we can take the things she can't burn and compare them with things she does, and find an estimate for the temperature she emits.

The thing with the highest melting point, we've ever seen Peril melt, is Aluminum. In Escaping Peril, Page 221, we see Peril melt an aluminum necklace, the book doesn't state that the necklace is aluminum, just that it's black. I originally assumed that it was made of Iron, which melts at 6,332 degrees Fahrenheit, but these numbers didn't match with the other calculations, so I used aluminum instead, which melts at 1,221 degrees Fahrenheit, and it fit much better.

The thing with the lowest melting point we've ever seen Peril not melt, is limestone. Limestone has a melting point of 1,517 degrees Fahrenheit. Followed closely by sandstone, which melts at 2,373.08 degrees Fahrenheit.

So, Peril's scales burn at a minimum heat of 1,221 Fahrenheit, but does not reach 1,517. But, I can hear you typing, this is ridiculous no living creature can withstand these extreme temperatures, much less emit them constantly. And you would be right, there is no possible way Peril can survive this heat, she would turn to ash.

But that isn't very interesting, yeah she's totally dead, but let's just assume that she's immune to heat.

Peril's powers are theorized, in the books, to originate from the rare condition of her egg, Peril is a twin, she, in the egg, stole her brother's fire, giving her too much, and him too little. This is, wrong, if we're going with the theory I proposed, that fire breathing is a biochemical reaction.

Finally we can talk about how Peril's scales work. So I actually created several diagrams of Peril's flesh and scales to figure out how they work, and I ended up with two different possibilities. One, a chemical reaction happening under the scales is heating them up, or two, a chemical film is being spread across her scales, by sweat gland-like structures. But neither of these solutions would produce enough heat to melt aluminum.

Note- What I meant earlier when I said "I originally assumed that it was made of Iron, which melts at 6,332 degrees Fahrenheit, but these numbers didn't match with the other calculations, so I used aluminum instead, which melts at 1,221 degrees Fahrenheit, and it fit much better." Was that if Peril was able to melt iron, and the melting point of Limestone is 1,517 degrees Fahrenheit, then Peril would shoot straight through the ground. Truly, sometime reality, is stranger then fiction.
Oh, wait, no. That would still be fiction.

The Science!!! Of Jason Grace

Unfortunately, I'm not a demi-god, but if I was, I would totally be a son of Athena. Greyish- blue eyes, book lover, writer... i'm rethinking my entire life.

Jason Grace, from the incredibly popular book series *Heroes of Olympus*, is the child of Jupiter, the Roman version of Zeus, and is able to do some pretty cool things because of it: Controlling the winds, creating storms, and coolest of all, summoning lightning bolts.

If we want to explain this feat of awesomeness, we'll have to explore how lightning is produced in our normal world, no murderous demi-gods involved.

In a storm cloud there is a soup of positive and negative charges, there's some debate as to how they get there, but this doesn't really matter one way or the other, to us. The soup is separated, positive charges on top of the cloud, and negative charges on the bottom, the Electrical field created by this separation, causes the surrounding air to become separated into positive ions and electrons, this air is ionized. This ionization just means that the electrons are spread farther apart, the purpose of this is so the electrons become free to move where they want, and where they want to go, is the positively charged ground.

The charge is going to aim for the Conductive Path, basically, the path of least resistance. The things that are the most conductive, and closest, to the cloud, are the things that are most likely to be struck.

So the best explanation for Jason's lightning throwing ability that I have is that Jason is making himself, or more often, his sword, the Conductive path, the easiest way to the ground, and then shifting the Conductive path onto his target, directing the lightning to his enemies.

And while How his powers work is interesting and all, what is far more interesting, is what effect this power would have on the target. The monsters in the *Heroes of Olympus* series, based on Greek and Roman mythological creatures, burst into golden dust when injured severely enough, but as you can probably guess, a human would not simply be turned to dust, no, the aftermath of a lightning strike, is gory and horrific.

In *The mark of Athena* page 130, Jason Grace, and Percy Jackson are possessed by Eidolons and are forced to fight each other to the death, they are evenly matched, both incredible swordsmen, sons of very powerful gods, and with powerful abilities of their own. During the brawl, Jason strikes Percy with a lightning bolt powerful enough to blast him off his Pegasus, makes his clothes smoke, and presumably knocks him out for a short spiel. Let me repeat that, a *54,000 degree Fahrenheit lightning bolt, a temperature five times hotter than the surface of the sun,* is just singing his clothes a bit. No, any demi-god, or any normal human would DIE!

Do you know why it's so dangerous to be under a tree during a lightning storm? Well I don't know what you said, I'm not a timetraveler (and even if I was, I wouldn't tell you), but I'm going to assume you said no. As I already stated, a lightning bolt is 54,000 degrees Fahrenheit, five times the heat on the surface of the sun. The boiling point of water, which the tree is stuffed with, is 212 degrees Fahrenheit, lightning gives 254.7 times the reqired heat for water to boil. A tree when struck by lightning, has almost, if not all, of its water evaporated almost immediately, the newly vaporized water expands, and the tree, unable to release all this pressure quickly enough, EXPLODES!!! Humans are made up of 65% water by weight, Demi-gods are presumably made up of the same stuff, can you see where I'm going with this?

Percy Jackson, the son of the sea god, in a terrible case of irony, DIES from having all the water in his body turned to vapor, turning him into a human balloon, and what happens when you add too much air to a balloon? IT EXPLODES!!!! Percy Jackson is splattered on highway Topeka 32 somewhere in Kansas!

I don't think I'll ever go outside again if there is so much as a single cloud in the sky.

☆ 0

SCIENTIST!!! **(nickname)**

There are equal amounts of bacteria in and on your body, as there are cells in your body, meaning that *you* are not just your cells, *you* are an **amalgamate** of creatures that form together to create *you*.

dragondrawing333

In the *spirit* (Ba Doom Ching!) of Hallowween, here is a *ghastly* (Hahaha) new theory.

The Science!!! Of the Women Who Befriended Ghosts

In the Rasom Rigg's *Tales Of The Peculiar* we get a short story about Hildy, A Syndrighast (the old peculiar language for a Peculiar) with the ability to see ghosts. Wait, if these stories are set in the same universe as the main story, *Miss Peregrine's home for Peculiar children*, that means *GHOSTS* exist in the main story line. WHAT? I see the entire story in a different way.

In the story, Hildy becomes lonely once her ghost sister and ghost parents leave for some Otherworldly business, and she tries through various methods to get other ghosts to play with her. But who cares about the story! We're here to do the SCIENCE!!!

Get out your Physics and Calculus books out, and turn to page- Hahahahahahahahahahaha! Forget that, I've already done it!

Okay, I think it's worth asking if these "Ghosts" are real. I know it's weird to question ghosts, when the entire story centers on people who are practically gods compared to the rest of us humans. But it's a necessary question, we have to question whether our informant is giving us accurate information. Remember Hildy's sister died when she was a child, and her parents, the only family she had left, just died, grief can do *interesting* things to the human body.

Let's just assume Hildy isn't crazy, for the purpose of Science!!! But are these things ghosts? There are scientific ways to disprove most ghost sightings, things in people's eyes, machines making odd noises, tricks of the light, but these are just coincidental, and is obviously not what Hildy is seeing. So what is she seeing? Infrasound.

Infrasound, sounds just on the edge of human hearing, things below Twenty hertz, were responsible for a supposed ghost haunting at Warwick castle, caused by a ventilation fan producing Infrasounds at just the right frequency to vibrate the eyeball. This could be what is causing her to see ghosts, but the "Ghosts" at Warwick castle, were blobs and misshapen forms, not the humanlike *Things* Hildy is seeing.

What I think is the most likely explanation, is the human brain itself. No! We're talking about ghosts, not zombies.
Let me ask you something, the last time something scared you, someone jumped out from behind a corner and yelled "BOO!" what did you do? Most likely, you jumped into the air and screamed, you weren't thinking about how it was just your dad pulling a badly thought out prank. Your brain, in an effort to keep you alive, when presented with a startling stimulus, say the grass rustling, is going to jump to the worst possible conclusion, as the saying goes "It's better to be safe, rather than screaming and dying on the ground, because a Rattle snake bit your ankle." That's how it goes, right?

I'm going to give you an example of this I experienced last night. I'm lying in bed about to fall asleep, and suddenly, I hear a scraping noise, I look up, and my door is slowly opening. My brain didn't go to the most logical conclusion, my little brother couldn't sleep and wanted to see if I was awake, no, it jumped to the conclusion that there was an intruder, and I needed to stab it.

(I didn't stab my little brother. I promise.)

But, there is a problem with the Concept of ghosts itself, if something is able to interact with us humans, and the world around us, in a corporeal way, then we would already know about them, probably. We, as a species, have searched through many different wavelengths of light, radioactivity, and many other things, if we suddenly stumbled upon ghosts at this point in time, it would be like if only now did we realize that we have toes, It's not *Impossible*, but it is *Incredibly unlikely*.

Also, Happy Halloween. Remember to check you candy before you eat it, don't follow any strangers, stay out of roads, and don't talk to anyone who dressed as a clown (The fear of clowns is called Coulrophobia.)

Or I Could Come Alone, Just Me, You On Our Own

The fear of falling apart

The SCIENCE! of Icewings

dragonlynx3311

let me have a try... but scientist got all the good topics...

The SCIENCE!!! of Rainwing venom

So, to begin, we need to define what the venom is and what it does. Mastermind the evil Nightwing... well, mastermind describes it as: “Deadly, toxic venom that essentially melts any dragon or plant life it comes into contact with”. And this would make sense,except that the only actual cure is venom from a blood relative. So I can kind of define it as:
Rainwing venom is an acidic substance that can be shot, long range or short range, out of the said Rainwing's fangs and destroys all living things that it touches.The only cure is venom from a blood relative, and if the second Rainwing is not related to the first,the melting only happens faster.
So the fact of the only cure almost certainly rules out chemical reactions (as chemicals cant actually recognize each other, they only affect one another. And Rainwing venom is all the same type of chemichal. Right?)
So I started researching, and I found that several types of animal have the power to shoot their blood out of their eyes. What if the same thing is happening in the rainwings? Here is my theory:
Step 1: An organ produces venom. For this, it needs the energy of the sun (as glory only developed the venom AFTER she left the caves) and water (as orchid passed out in the dark secret while shooting venom because she was dehydrated)
step 2:The freshly made venom passes up to a gland near the fangs (got that idea from the venomous Gila monster). While in the bloodstream, it collects information about the DNA of the dragon that shoots it.
step 3: the venom in the gland can be shot out through the fangs, a skill that improves with age.

Yay me!
